

NEUMANN STEEL
REINFORCING

Stainless Steel Reinforcing Bars

- Corrosion resistant
- Prevents chloride induced corrosion in reinforced concrete
- More resistant to abrasion and damage during construction
- Low conductivity and high strength at elevated temperatures
- Less concrete cover required

Stainless Steel Reinforcing is used in order to ensure a high level of corrosion resistance.

If there are areas which will be exposed to corrosive elements, or if access is difficult to achieve then stainless steel is a good option to ensure structural integrity is maintained even in the absence of regular maintenance and repairs being carried out. Stainless Steel rebar can be cut and bent without damaging the coating.

Stock Sizes

Product Code	Diameter (mm)	Length (mm)
SS12/4.1	12mm	4100mm
SS16/4.1	16mm	4100mm
SS20/4.1	20mm	4100mm
